Water sources namely, rivers, dams, furrows, springs, wells, boreholes and rainwater were analyzed for selected physicochemical properties that included: pH, total alkalinity, dissolved oxygen (DO), turbidity, color, electrical conductivity (EC) and salinity, and screened for pathogenic bacteria (Total coliforms, E. coli, Shigella, Salmonella, V. cholerae, Klebsiella, S. faecalis, C. perfringens) to ascertain if the water met the required healthy standards. Physico-chemical and bacteriological quality of water ... pH, hardness, presence of a selected group of chemical parameters, biocides, highly toxic chemicals, and B.O.D are estimated. pH is a measure of hydrogen ion concentration. It is an indicator of relative acidity or alkalinity of water. Values of 9.5 and above indicate high alkalinity while values of 3 and below indicate acidity.
