Digital signal processing (DSP) is the use of digital processing, such as by computers or more specialized digital signal processors, to perform a wide variety of signal processing operations. The digital signals processed in this manner are a sequence of numbers that represent samples of a continuous variable in a domain such as time, space, or frequency. Digital signal processing - Wikipedia This signalled the birth of sound processing, which would go on to contribute to the development of digital signal processing or DSP. Digital signal processing covers a wide range of functions. These range from recognising your voice when you say "OK Siri" to monitoring temperature or colour in safety equipment. But it is the processing of sound signals that we will look at in this article. Audio engineers and producers often refer to DSP as Digital Sound Processing. Read Download Digital Signal Processing In Modern ... A digital signal processor (DSP) is a specialized microprocessor (or a SIP block), with its architecture optimized for the operational needs of digital signal processing. The goal of DSP is usually to measure, filter or compress continuous real-world analog signals. Most general-purpose microprocessors can also execute digital signal processing algorithms successfully, but may not be able to keep up with such processing continuously in real-time.
