For N-containing heterocyclic-ring-based organic materials, the planarity of the pentatomic-ring framework is beneficial for the lone-pair electron of the nitrogen atom to participate in conjugation and delocalization to the whole heterocycle skeleton, which would simultaneously weaken the activity of the single-electron free radical in the intermediate and decrease the electron density of the nitrogen redox center. Dilution of the Electron Density in the ... - Chemistry Europe These two drawings are an example of what is referred to in organic chemistry as resonance contributors: two or more different Lewis structures depicting the same molecule or ion that, when considered together, do a better job of approximating delocalized pi-bonding than any single structure. By convention, resonance contributors are linked by a double-headed arrow, and are sometimes enclosed ... 6.2: Resonance - Chemistry LibreTexts The two-way reactions among these three forms occur very simply due to the low one-electron transfer potential. As a consequence, ascorbic acid has been accepted as a chemically unstable substance.
