methods for finite element matrix
equations are plentiful. In the case
of the linear static $Kd = r$, inverting
K is computationally expensive and

numerically unstable. A better technique is Cholesky factorization, a form of Gauss elimination, and a minor variation on the "LDU" factorization theme. $u_{11} = 1 + t$. The solution to this general differential equation is $u = Ae^{kt} + B - t$; with the initial condition that $u(0) = 1$, it in effect states that $u = 1 + t$ for all time.
