Molecular chaperones are ubiquitous, highly conserved proteins accounting for 1% to 2% of all cellular proteins in most normal cells. 48 Chaperones play a pivotal role in maintaining cellular homeostasis by assisting other substrate proteins, also

known as clients, to fold properly, by stabilizing the intermediates of its clients during folding or intercellular transportation, and by aiding in protein degradation. In molecular biology, molecular chaperones are proteins that assist the conformational folding or unfolding and the assembly or disassembly of other macromolecular structures. Chaperones are present when the macromolecules perform their normal biological functions and have correctly

completed the processes of folding and/or assembly. The chaperones are concerned primarily with protein folding. The first protein to be called a chaperone assists the assembly of nucleosomes from folded histones and
