bispectrum is particularly of use
when the analyst wishes to detect
quadratic (or other even powers of)
nonlinearity. The next in the series
of higher-order spectra is the fourth-
order spectra, the trispectrum. The
trispectrum is particularly useful
when analysing a signal for cubic

nonlinearity. Higher-order spectra

(HOS) analysis is often applied
effectively to analyze many bio-
medical signals to detect nonlinear
and non-Gaussian processes. One
of the most basic HOS methods is
the bispectral estimation, which
extracts the degree of quadratic
phase coupling between individual
frequency components of a
nonlinear signal. Most of the studies
in this direction as applied to ECG

Higher order spectral analysis of ECG signals extensions to the familiar power spectrum at 3rd, 4th and higher orders. These "Higher Order Spectra", or "Polyspectra" provide supplementary information to the power spectrum. The 3rd order polyspectrum is the easiest to compute, and hence the most popular, and is called the Introducing Higher Order Statistics (HOS) (2020). moment of spectra which are able to detect non-linear interactions between frequency components. For HOS, the most commonly used is the bispectrum. The bispectrum is the third-order frequency domain measure, which contains information that standard power spectral analysis techniques cannot provide. It is well known

Furthermore, failure detection methods based on higher-order statistical analysis have been applied to vibration signals, by considering the information provided by cumulants and moments of orders greater than or equal to two, as well as the spatial information that extracted from the analysis of higher-order spectra
