Macroeconomics A Mathematical Approach 1st Published A macroeconomic model is an analytical tool designed to describe the operation of the problems of economy of a country or a region. These models are usually designed to examine the comparative statics and dynamics of aggregate quantities such as the total amount of goods and services produced, total income earned, the level of employment of productive resources, and the level of prices. Macroeconomic model - Wikipedia Mathematical economics is the application of mathematical methods to represent theories and analyze problems in economics. By convention, these applied methods are beyond simple geometry, such as differential and integral calculus , difference and differential equations , matrix algebra , mathematical programming , and other computational methods . Mathematical economics - Wikipedia In modern macroeconomics the economy is portrayed as a dynamic general equilibrium (DGE) system that reflects the collective decisions of rational individuals over a range of variables that relate to

both the present and the future. These individual decisions are then coordinated through markets to produce the macroeconomy. Macroeconomic Theory The simple linear equation (since it is a straight line) for the demand curve is $q = a - bp$ where q is quantity, p is price and a and b are constants. The relation between quantity demanded at various prices being an inverse one implies the line has a negative slope. We can also depict this in relation to price. Example 1.3 Consider the function $f(x_1, x_2) = -ax_1^2 - bx_2^2 + cx_1x_2 - x_1 - x_2$ where $a, b > 0$ and $4ab - c^2 > 0$. The first order conditions are: $\partial f(x^*) / \partial x_1$. Suppose a firm faces a demand curve for its product $P = a - bQ$, and the firm's costs of production and marketing are $C(Q) = cQ + d$, where P is price, Q is quantity, and a , b , c , and d are positive constants.
