Understanding macroscopic properties of matter starting from microscopic chaos in the equations of motion of single atoms or molecules is a key problem in nonequilibrium statistical mechanics. Of particular interest both for theory and applications are transport processes such as diffusion, reaction, conduction and viscosity. Microscopic chaos, fractals and transport in ... The surprising new results include transport coefficients that are fractal functions of control parameters, fundamental relations between transport coefficients and chaos quantities, and an understanding of nonequilibrium entropy production in terms of fractal measures and attractors. The theory is particularly useful for the description of many-particle systems with properties in-between conventional thermodynamics and nonlinear science, as they are frequently encountered on nanoscales. introduction to modern research in
transport theory which relates
macroscopic properties of large
systems to underlying microscopic
dynamics. The book does not
pretend to be mathematically
rigorous but presents an extremely
readable account of the conceptual
foundations of nonequilibrium
statistical mechanics.
