The urinary system, also known as the renal system, produces, stores and eliminates urine, the fluid waste excreted by the kidneys. The kidneys make urine by filtering wastes and extra water from... Urinary System: Facts, Functions & Diseases | Live

Science The renal system is a group of organs that work together to produce, store, and release urine. Urine is the liquid waste material excreted from the body. The organs that work together in this system include the kidneys, bladder, ureters, and urethra. It is also known as the urinary or the excretory system. What Is the Renal System? (with pictures) A system of filtration units within the kidney regulates levels of dilution (water), salts and other small molecules in the filtrate. Any excess or undesired products travel through each ureter and are deposited into the reservoir of the bladder, while purified blood re-enters the circulatory system by way of the renal vein. Urinary System - Definition, Function and Organs | Biology ... Following the
